Variazione percentuale delle emissioni di CO₂eq in Lombardia dal 1990 al 2007 per macrosettore

	1990 - 2001	2001-2003	2003-2005	2005-2007	1990-2007
	%	%	%	%	%
1-Produzione energia e trasform. combustibili	23 %	-5,9 %	30 %	-1,3 %	49 %
2-Combustione non industriale	-11 %	6,9 %	7,2 %	-9,7 %	-8,3 %
3-Combustione nell'industria	-1,3 %	-5,4 %	-15 %	4,9 %	-17 %
4-Processi produttivi	-0,8 %	14 %	13 %	1,1 %	29 %
5-Estrazione e distribuzione combustibili	15 %	12 %	0,5 %	-16 %	9,4 %
6-Uso di solventi			6,8 %	7,2 %	169 %
7-Trasporto su strada		49 %	-2,7 %	-2,0 %	0,4 %
8-Altre sorgenti mobili e macchinari		-51 %	124 %	5,2 %	-5,0 %
9-Trattamento e smaltimento rifiuti		123 %	4,6 %	-14 %	7,8 %
10-Agricoltura		-6,3 %	0,6 %	-3,0 %	2,9 %
11-Altre sorgenti e assorbimenti		-87 %	4,2 %	-3,2 %	3,7 %
Totale	7,9 %	2,6 %	4,2 %	-1,6 %	13 %

Attività in corso

- Versione definitiva inventario 2007 /aggiornamento a 2008
(entro settembre 2010)

Correzioni (es. errori di attribuzione attività SNAP)

Affinamenti (nuovi dati puntuali, nuovi F.E., ecc)

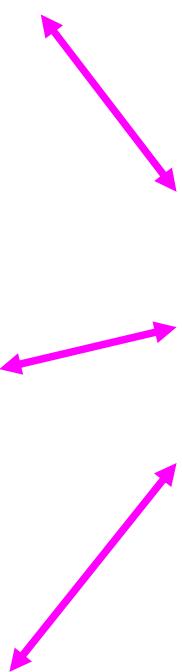

Aggiunte (es. impianti puntuali ?)

Aggiornamenti (es. artemis, Copert nuovi FE mezzi pesanti)

Attività in corso / future già previste

Approfondimenti metodologici

Miglioramenti informatici su Inemar

Con risorse
ARPA/Regione

Con risorse

Possibili ulteriori approfondimenti

- Ruolo centrale delle emissioni dalla combustione della legna, sia per le emissioni attuali che per gli scenari di emissione: ruolo chiave per l'affinamento delle stime di PM, COV e composti tossici a livello locale
- Aggiornamento periodico consumi di legna da ardere
- Approfondimenti su Off-road (indicatori e FE)
- Approfondimenti sulle percorrenze dei veicoli passeggeri e merci
- Approfondimenti su emissioni di COV
- Emissioni dalla combustione delle paglie di riso e biomasse del settore agricoltura
- Indagine sul consumo di combustibili e carburanti nelle attività agricole (trattori - riscaldamento serre - essiccatori)
- Emissioni di "soot" (fuliggine)

WOOD COMBUSTION Lombardy region

In all the municipalities in the plain (altitude < 300 meters) in Lombardy region, from winter 2006/2007 wood combustion has been prohibited in all the appliances:

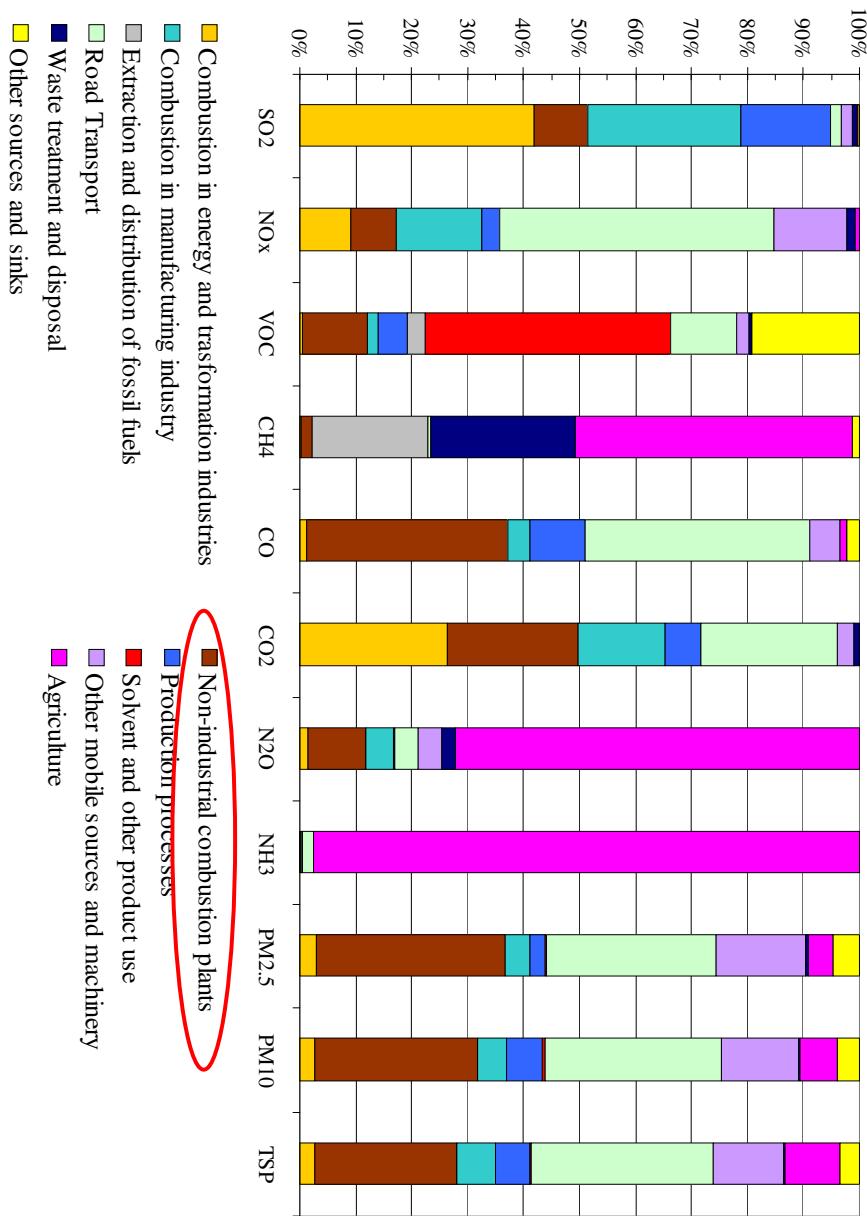

- with less than 65 % of thermal efficiency
- with CO emissions > 5000 ppm

→ The use of fireplaces is prohibited

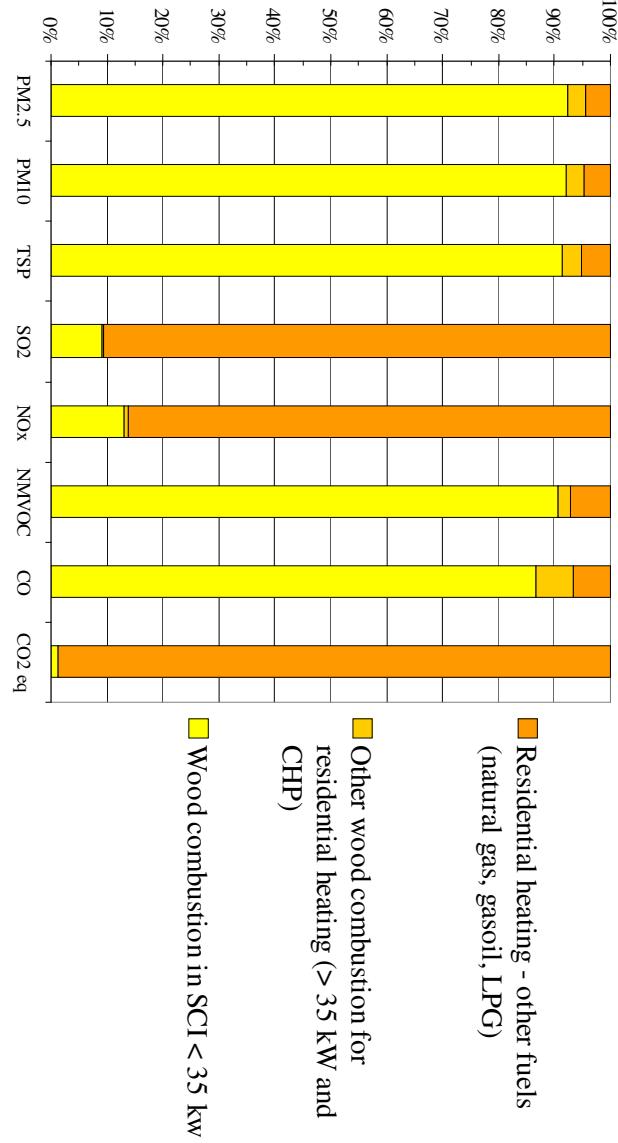

Small awareness, very few controls...

Fuel oil use for household heating has been prohibited since winter 2004/2005 in all Lombardy

Emmissions in Lombardy by SNAP group (year 2007)

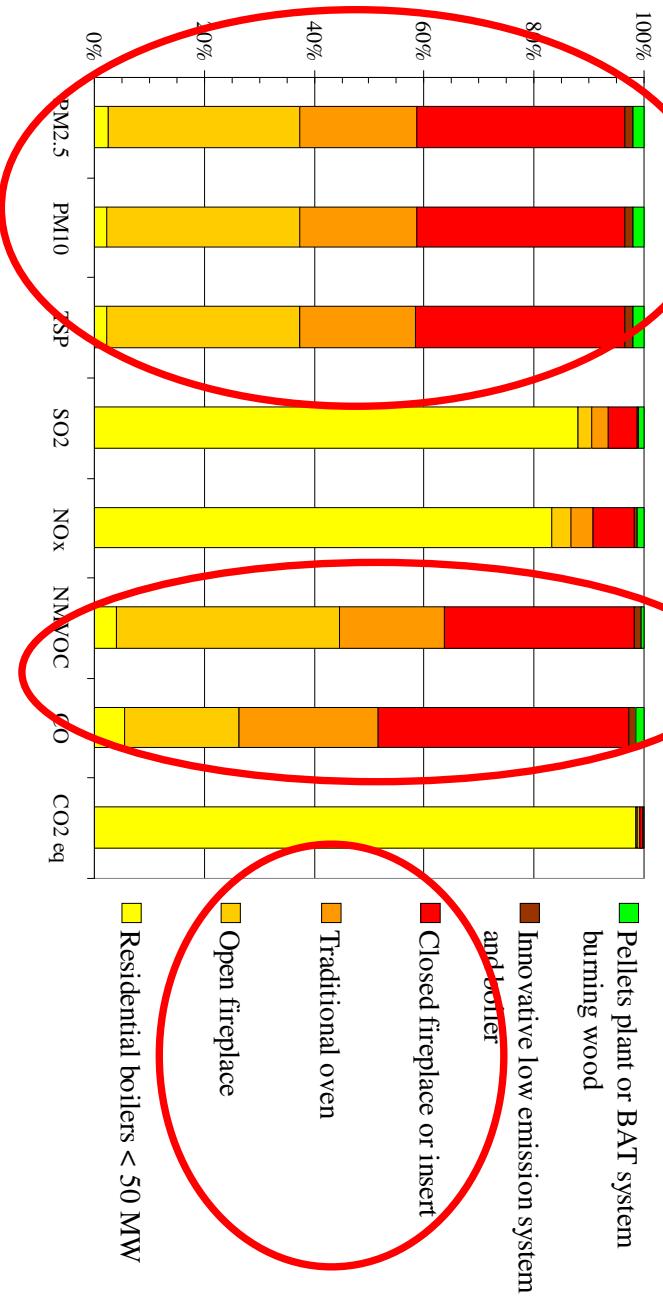

Lombardy 2007 emissions for domestic heating, CHP included

Although the number of SCI > 35 kW are increasing, their contribution to PM, VOC and CO emissions in Italy is very small if compared to emissions from SCI < 35 kW

The emission inventory consider five type of wood burning appliances; one type (< 50 MW) is considered for gas and liquid SCI

Lombardy 2007 emissions in the SNAP groups 2 - domestic heating, by SNAP – level III (type of appliances)

Emission come from very small combustion installation (< 35 kW)

The role of wood combustion as a source of PM has been confirmed by studies on the presence of wood tracers in air samples.

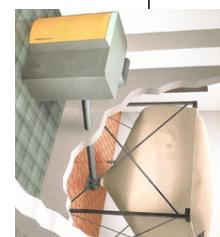

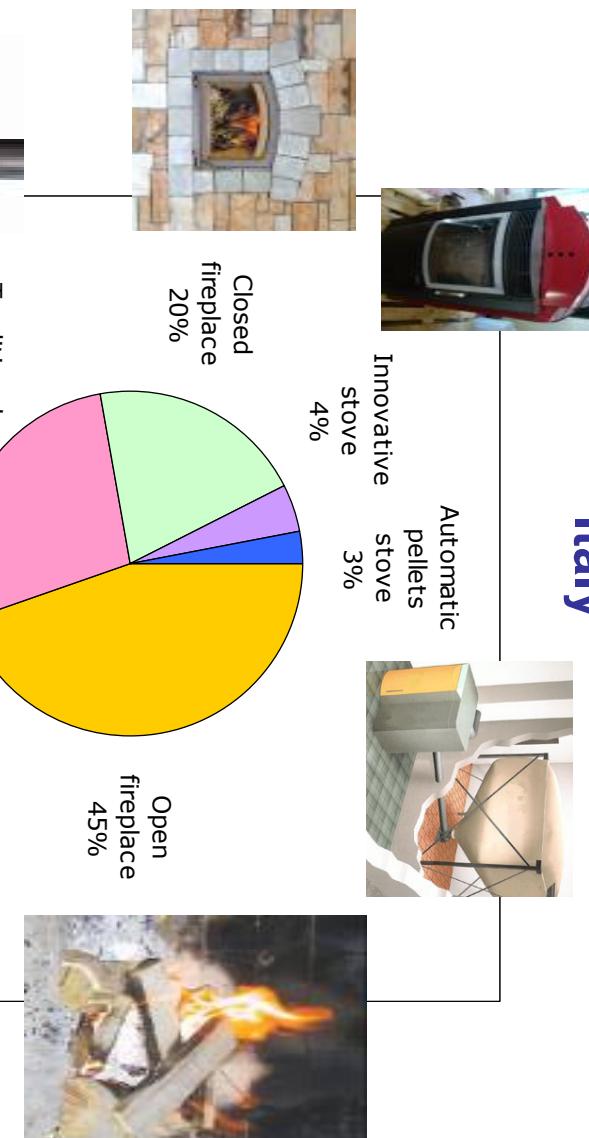

Although secondary aerosol formation is more relevant than primary emissions for both coarse and fine PM fraction, wood burning is relevant also in urban areas and strongly contributes to high peak of PM.

Critical point in the assessment of emission from small wood combustion installations

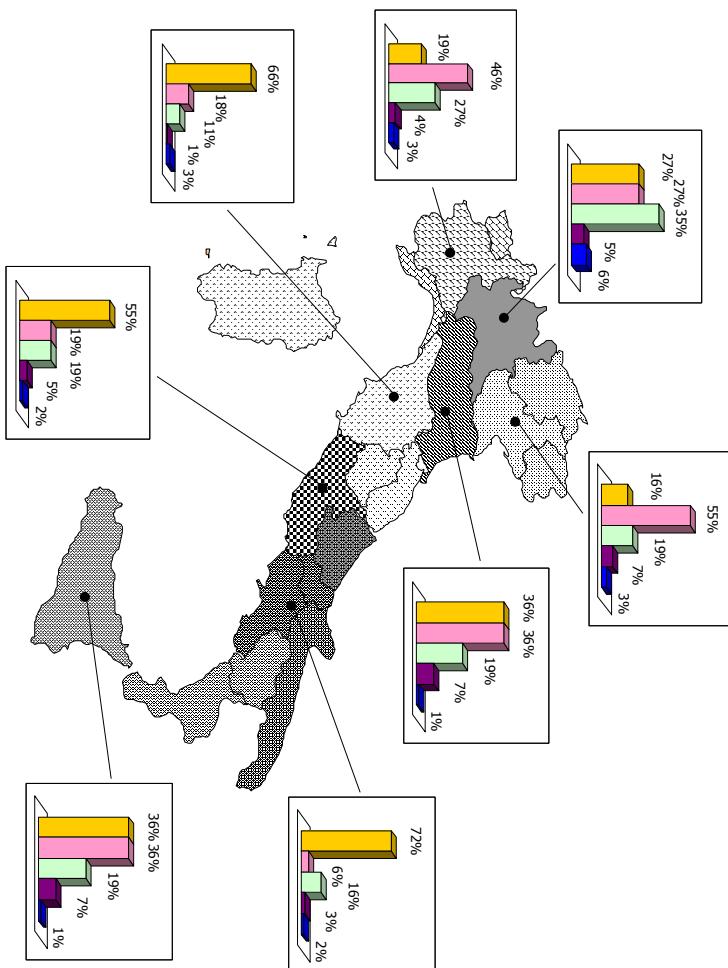

1. Assessment of wood consumption for different type of appliances
2. Assessment of actual emission factors (in the real operating conditions)

Distribution of wood combustion systems in Italy

Italy

% number of appliances

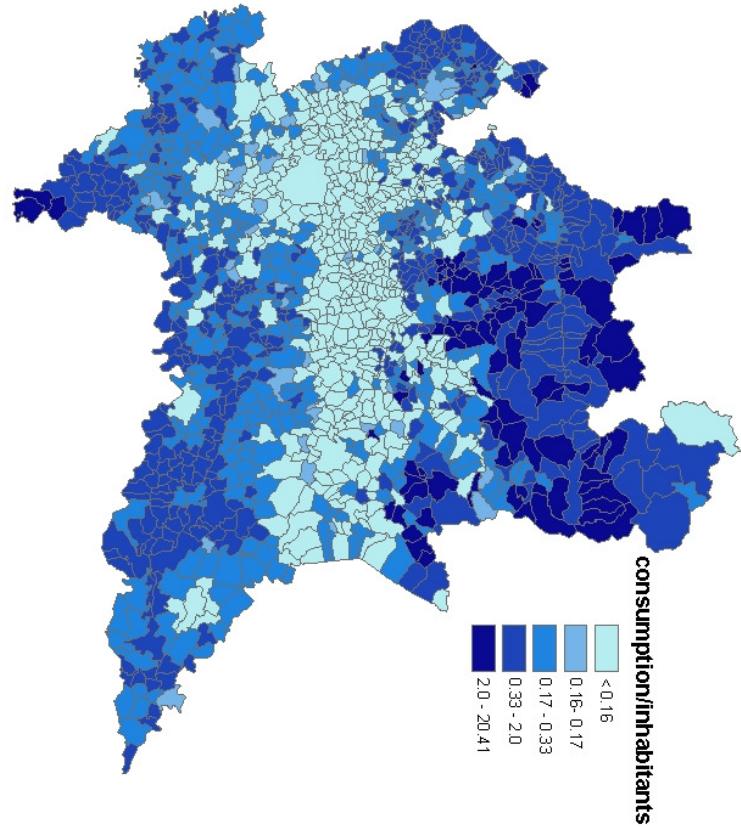

Legend:

- Open fireplace
- Traditional stove
- Closed fireplace
- Innovative stove
- Automatic pellets stove

Assessment of real emission factors

It is important to consider the **condensable fraction**, material that is vapor phase at stack conditions, but which condenses and/or reacts upon cooling and dilution in the ambient air to form solid or liquid PM immediately after discharge from the stack.

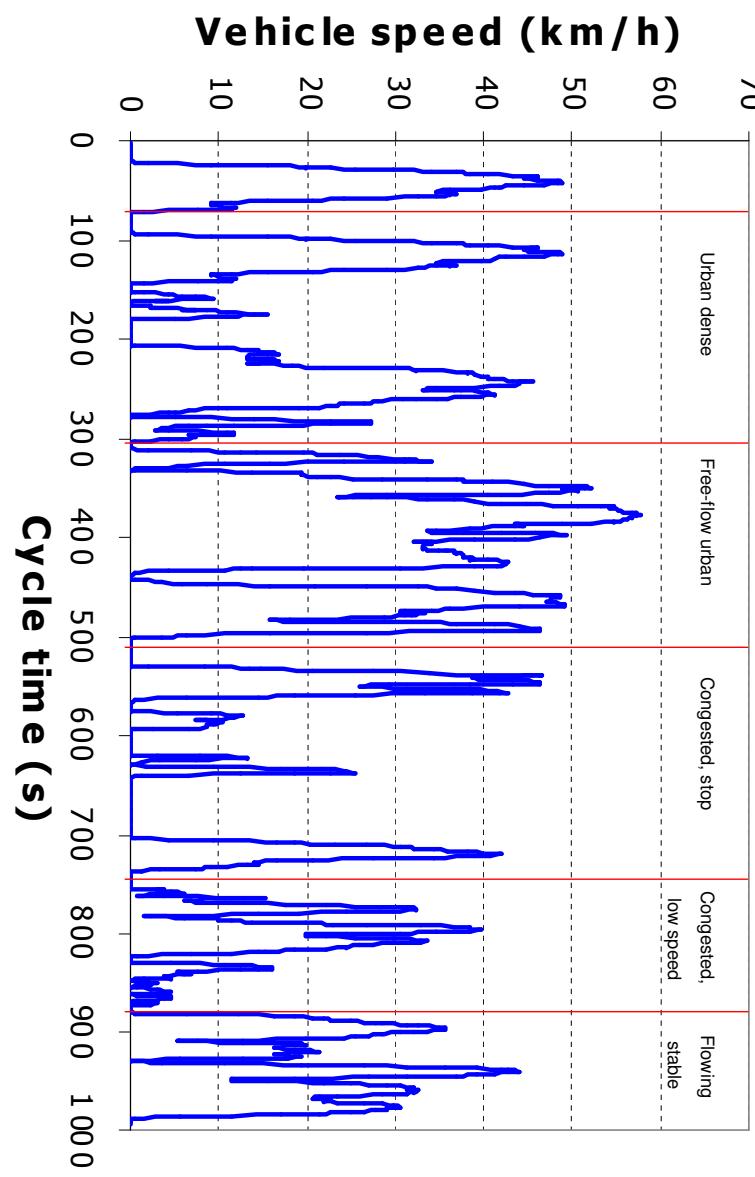

It is important to consider emissions **during transient conditions** (**start up**)

Need to consider the real burning cycle ?

Is type of wood relevant to the average EF ?

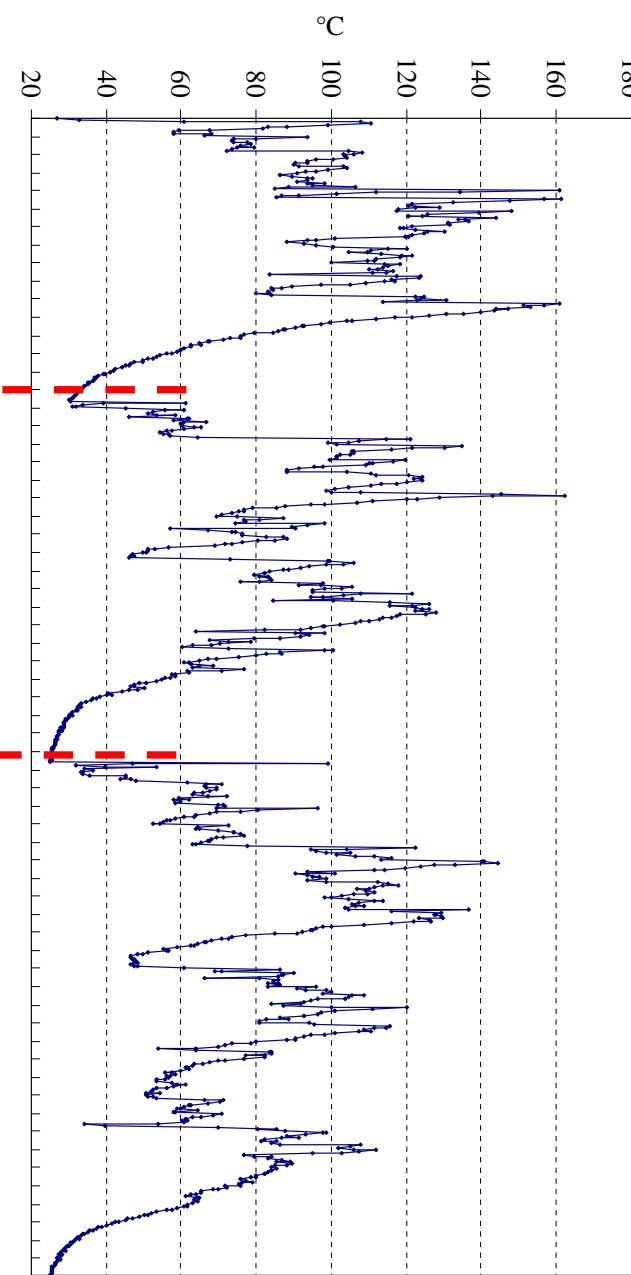

For road transport emission factor assessment, different reference cycles has been defined

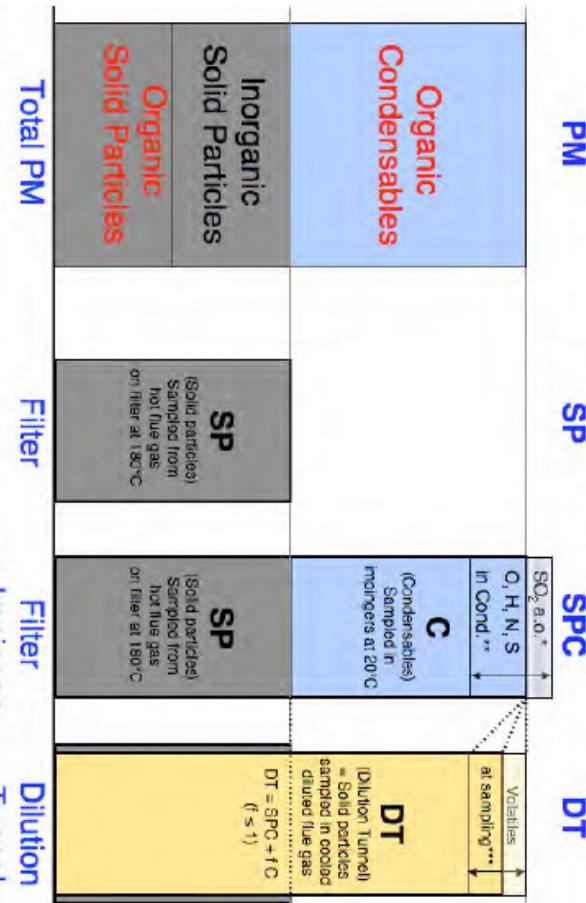

Figure 4.4

Comparison of different sampling methods with total PM in the flue gas. Explanations:

PM: Total Particulate Matter in flue gas at ambient temperature.

SP: Filter (Method a) resulting in solid particles SP.

SPC: Filter + Impinger (Method b) resulting in solid particles and condensables SPC.

DT: Dilution Tunnel (Method c) resulting in a PM measurement including SPC and most or all C. Hence DT is identical or slightly smaller than SPC + C due to potentially incomplete condensation depending on dilution ratio and sampling temperature (since dilution reduces not only the temperature but also the partial pressure of contaminants).
